On existence of independent sets in partially ordered sets

Joanna Jureczko

Cardinal Stefan Wyszynski University in Warsaw (Poland)

Winter School Hejnice 2013

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

The strong sequences method was introduced by B. A. Efimov, as a useful method for proving famous theorems in dyadic spaces like: Marczewski theorem on cellularity, Shanin theorem on a calibre, Esenin-Volpin theorem, Erdös-Rado theorem and others.

(日) (日) (日) (日) (日) (日) (日)

Let T be an infinite set. Denote the Cantor cube by

$$D^T = \{ p \colon p \colon T \to \{0,1\} \}.$$

For  $s \subset T$ ,  $i: s \rightarrow \{0, 1\}$  it will be used the following notation

$$H_s^i = \{ p \in D^T : p | s = i \}.$$

Efimov defined strong sequences in the subbase  $\{H'_{\{\alpha\}}: \alpha \in T\}$  of the Cantor cube and proved the following

# Theorem (Efimov)

Let  $\kappa$  be a regular, uncountable cardinal number. In the space  $D^T$  there is not a strong sequence

$$(\{H^{i}_{\{lpha\}}: lpha \in v_{\xi}\}, \{H^{i}_{\{eta\}}: eta \in w_{\xi}\}) \; ; \; \; \xi < \kappa$$

・ロト ・聞ト ・ヨト ・ヨト 三日

such that  $|w_{\xi}| < \kappa$  and  $|v_{\xi}| < \omega$  for each  $\xi < \kappa$ .

Let *X* be a set, and  $B \subset P(X)$  be a family of non-empty subsets of *X* closed with respect to finite intersections. Let *S* be a finite subfamily contained *B*. A pair (*S*, *H*), where  $H \subseteq B$ , will be called *connected* if  $S \cup H$  is centered.

(日) (日) (日) (日) (日) (日) (日)

Let *X* be a set, and  $B \subset P(X)$  be a family of non-empty subsets of *X* closed with respect to finite intersections. Let *S* be a finite subfamily contained *B*. A pair (*S*,*H*), where  $H \subseteq B$ , will be called *connected* if  $S \cup H$  is centered.

## Definition (Turzański)

A sequence  $(S_{\phi}, H_{\phi})$ ;  $\phi < \alpha$  consisting of connected pairs is called *a strong sequence* if  $S_{\lambda} \cup H_{\phi}$  is not centered whenever  $\lambda > \phi$ .

(日) (日) (日) (日) (日) (日) (日)

## Theorem (Turzański)

If for  $B \subset P(X)$  there exists a strong sequence  $S = (S_{\phi}, H_{\phi}); \phi < (\kappa^{\lambda})^{+}$  such that  $|H_{\phi}| \leq \kappa$  for each  $\phi < (\kappa^{\lambda})^{+}$ then there exists a strong sequence  $(S_{\phi}, T_{\phi}); \phi < \lambda^{+}$ , where  $|T_{\phi}| < \omega$  for each  $\phi < \lambda^{+}$
